## RVE TYPE REDUCER INSTALLATION ESSENTIALS

为了充分发挥RVE减速器的性能，需要对减速器安装精度、安装方法、润滑以及密封进行最佳设计。

In order to make fully use of RVC type reducer, it is need to make a best design of the assembly precision, installation method, lubrication and seal.

### 装配精度 Assembly Precision

电机轴同减速器的同轴度误差 $a$ 小于0.03mm (280BX以上机型小于0.05)。  
Coaxiality tolerance ( $a$ ) of motor shaft and reducer is lower than 0.03mm (For models above 280BX, lower than 0.05).

如安装精度不良，特别容易造成振动及噪音。

Because of the poor assembly accuracy, especially easy to cause vibration and noise.

### ● 电动机的转矩限制 Torque Limit Of The Motor

为了不让作用于减速机的冲击转矩超过瞬时最大容许转矩值，需要对电动机的转矩值设定限制。

In order to prevent the impact torque acting on the reducer from exceeding the instantaneous maximum allowable torque value, it is necessary to set a limit on the torque value of the motor.

设定项目/研究事项 Set The Project / Research matters	计算公式 Calculation Formula	选定例 (水平方向旋转移动时) Selected Example (When the horizontal direction is rotated)
$T_{m1}$ ----- 电动机瞬时最大转矩 (Nm) Maximum instantaneous torque of the motor	由电动机规格决定。 According to the motor specifications.	例如 For example: $T_{M1} = 10(\text{Nm})$
$T_{M1OUT}$ ----- 减速机输出轴最大发生转矩 (Nm) The maximum torque of the gearbox output shaft  (因紧急停止以及电动机停止而受到外部冲击时) (Due to emergency stop and the motor stopped by the external red hit time)	$T_{M1OUT} = T_{M1} \times R \times \frac{100}{\eta}$ R: 实际减速比。 Actual reduction ratio. $\eta$ : 启动效率(%), 参考P.08-P.09额定值表。 Start efficiency (%), refer to P.08-P.09 rating table.	例如, 根据选定150BX-RVE-161K时的规格计算。 For example, Calculated according to the specifications when 150BX-RVE-161K is selected. $T_{M1OUT} = 10 \times 161 \times \frac{100}{80} = 2012(\text{Nm})$
$T_{M2OUT}$ ----- 减速机输出轴最大发生转矩 (Nm) The maximum torque of the gearbox output shaft  (输出轴与障碍物相撞而受到冲击时) (The impact caused by output shaft impacts the obstacle)	$T_{M2OUT} = T_{M1} \times R \times \frac{\eta}{100}$	$T_{M2OUT} = 10 \times 161 \times \frac{80}{100} = 1288(\text{Nm})$
电动机转矩值的限制 Limit of motor torque value	确认是否 Confirm whether or not 瞬时最大容许转矩【 $T_{s2}$ 】 Instantaneous maximum permissible torque 【 $T_{s2}$ 】 $\geq$ 减速机输出轴最大发生转矩【 $T_{M1OUT}$ 】、【 $T_{M2OUT}$ 】。 $\geq$ The maximum torque of the output shaft of the gear unit 【 $T_{M1OUT}$ 】, 【 $T_{M2OUT}$ 】。 不能满足以上算式时, 对电动机的最大转矩值进行限制。 When the above formula can not be satisfied, Limit the maximum torque valve of the motor. 【 $T_{s2}$ 】: P.09-P.10定格表参照。 P.09-P.10 fixed table reference.	由于 Due to 【 $T_{s2}$ 】 $820(\text{Nm}) \leq$ 【 $T_{M1OUT}$ 】 $2012(\text{Nm})$ 【 $T_{M2OUT}$ 】 $1288(\text{Nm})$ 因此对电动机设定转矩限制。 So the torque limit is set for the motor.
